What is Lambda Expression

Lambda is anonymous Function

- No Name
- No Modifier
- No Return Type

```
public void m1()
{
    SOP("Test");
}
```

```
( ) →
{
    SOP("Test");
}
```

Benefits Of Lambda

- Reduces the lines of Code.
- Sequential and Parallel execution support by passing behavior as an argument in methods
- To call APIs Very effectively
- To Write more Readable , Maintainable and Concise code.

```
public int sum(int a, int b)
{
    return (a+b);
}
```

⇒

```
(int a, int b) →
{
    return (a+b);
}
```

Important Rules of Lambda

If the body of Lambda Expression contain only one statement then curly braces are optional

Java compiler also inter the type of variable passed in arguments , hence type is optional

Functional Interface

If the interface contains only one abstract methods then it is Functional Interface

Ex: Runnable, Callable , Comparable etc.

To call lambda we require functional Interface.

Lambda is used to implement functional interface in very simple and short maner.
